

KINETIC SCULPTURE

Your kinetic sculpture is made entirely of stainless steel and will maintain its luster for years and years.

The blades have been balanced and should never be bent in any way. The Tufflon bushings (supplied) are self-lubricating and self-cleaning.

Never add any lubricant of any kind to the bushings.

Replace bearing then lock collar leaving a $1/16$ inch gap of play so blade turns freely. Tighten lock collar with a $1/8$ inch Allen Wrench. Repeat procedure on opposite side making sure that the blades are turning in opposite directions.

If you plan to attach your sculpture to a building of any kind it will have to be electrically grounded just like a weather vane or lighting rod.

For best results put sculpture at least 8 ft off the ground in open breezy area away from trees and other wind blockers.

Your new piece of kinetic sculpture is made of stainless steel and will retain its luster for years. The blades have been balanced and should not be bent in any way. The plastic bushings are self-lubricating and self-cleaning, please do not add lubricant to them.
